

# Bayesian Spam Detection

Jeremy Eberhardt

University of Minnesota, Morris

*eberh060@morris.umn.edu*

December 6, 2014

# What is it?

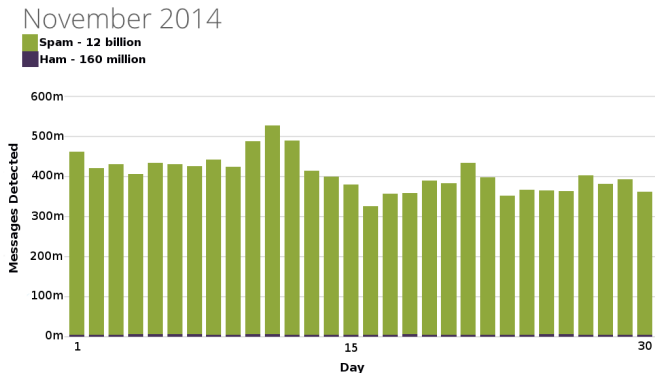

- Spam
  - Anything that is undesired by the user
  - Email spam
  - Comment spam
- Ham
  - Non-spam
- Bayesian Approach
  - Statistics based document classification

"Wow! I've got one from someone I know!"

# Why do We Care?

- 70-90% of all emails are spam
- Global issue
- Security
  - Advertising
  - Scams
  - Identity theft
- Quality of life

# Overview

- 1 Intro
  - Setup
- 2 Naive Bayes
  - Explanation and example
- 3 Multinomial Bayes
  - Explanation and example
- 4 Multivariate Bayes
  - Explanation and example
- 5 Feature Selection
- 6 Tests
  - Multinomial Bayes
  - Multivariate Bayes
- 7 Conclusion

- Training data
  - Prepare the filter before use
  - Pre-classified documents that the user specifies
- *Prior* probability
  - Probability that an event occurs
- *Conditional* probability
  - Probability of an event given that another event has occurred

- Training data
  - Prepare the filter before use
  - Pre-classified documents that the user specifies
- *Prior* probability
  - Probability that an event occurs
- *Conditional* probability
  - Probability of an event given that another event has occurred

$P(\textit{snowing})$  VS  $P(\textit{snowing}|\textit{summer})$

# Naive Bayes Classifier

$$P(S|W) = \textit{Spamicity}(W)$$

The probability that a document is spam given that word  $W$  occurs in the document.

$$\frac{\textit{Count}(S, W) \cdot P(S)}{\textit{Count}(S, W) \cdot P(S) + \textit{Count}(H, W) \cdot P(H)}$$

# Classify the Document

$$P(S|All\ words) = \frac{Spamicity(All\ words)}{Spamicity(All\ words) + Hamicity(All\ words)}$$

Compare to threshold or

$$P(H|All\ words) = \frac{Hamicity(All\ words)}{Hamicity(All\ words) + Spamicity(All\ words)}$$

# Naive Bayes Example

## Spamicity

$$\frac{\text{Count}(S, W) \cdot P(S)}{\text{Count}(S, W) \cdot P(S) + \text{Count}(H, W) \cdot P(H)}$$

## Classification

$$\frac{\text{Spamicity}(\text{All words})}{\text{Spamicity}(\text{All words}) + \text{Hamicity}(\text{All words})}$$

## Doc Content

1	Purple Black Purple Circle	H
2	Circle Square Square Red	S
3	Square Purple	S
	Purple Purple Circle	?

# Naive Bayes Example

## Spamicity

$$\frac{\text{Count}(S,W) \cdot P(S)}{\text{Count}(S,W) \cdot P(S) + \text{Count}(H,W) \cdot P(H)}$$

## Classification

$$\frac{\text{Spamicity}(\text{All words})}{\text{Spamicity}(\text{All words}) + \text{Hamicity}(\text{All words})}$$

$$S(\text{Purple}): \frac{1 \cdot 2/3}{(1 \cdot 2/3) + (1 \cdot 1/3)} = 2/3$$

$$S(\text{Circle}) = 4/5$$

$$H(\text{Purple}): \frac{1 \cdot 1/3}{(1 \cdot 1/3) + (1 \cdot 2/3)} = 1/3$$

$$H(\text{Circle}) = 1/5$$

Purple Purple Circle ?

$$P(S) = \frac{0.667 \cdot 0.8}{(0.667 \cdot 0.8) + (0.333 \cdot 0.2)} \approx 0.89$$

$$P(H) = \frac{0.333 \cdot 0.2}{(0.333 \cdot 0.2) + (0.667 \cdot 0.8)} \approx 0.11$$

**Spam**

# Multinomial Bayes

- Optimization of Naive Bayes classifier
- Multinomial distribution of words
- Words are independent
- Instead of counting documents, count words
- Instead of calculating  $P(S|W)$  calculate  $P(W|S)$

$$P(S|All\ words) = P(S) \cdot P(W_1|S)^{f_1} \cdot \dots \cdot P(W_n|S)^{f_n}$$

$\uparrow$                        $\uparrow$   
*Prior*                      *Conditional*

# Multinomial Bayes Example

## Priors

$$P(H) = \frac{1}{3} \quad P(S) = \frac{2}{3}$$

## Conditional

$$P(W|S) = \frac{\text{Count}(W,S)+1}{\text{Count}(S)+\text{Vocabulary}}$$

## Doc Content

3	Square Purple	S

*Purple Purple Circle* ?

$$P(S) = 2/3 * (2/11)^2 * 2/11 \\ \approx 0.004$$

$$P(H) = 1/3 * (3/9)^2 * 2/9 \\ \approx 0.008$$

**Ham**

- Another optimization of Naive Bayes
- Similar to Multinomial Bayes, simpler
- Combines ideas from Naive Bayes and Multinomial Bayes
- Calculate probabilities like Multinomial Bayes
- Counts documents like Naive Bayes

$$P(S|All\ words) = P(S) \cdot P(W_1|S)^{f_1} \cdot \dots \cdot P(W_n|S)^{f_n}$$

$$P(S|All\ words) = P(S) \cdot P(W_1|S)^{f_1} \cdot \dots \cdot P(W_n|S)^{f_n}$$

$\uparrow$                        $\uparrow$                        $\downarrow$   
*Prior*                      **Conditional**                      **1**

# Multivariate Bayes Example

## Priors

$$P(H) = \frac{1}{3} \quad P(S) = \frac{2}{3}$$

## Conditional

$$P(W|S) = \frac{1 + \text{Count}(S, W)}{2 + \text{Count}(S)}$$

## Doc Content

1	Purple Black Purple Circle	H

*Purple Purple Circle* ?

$$P(S) = 2/3 * 1/2 * 1/2 \approx 0.166$$

$$P(H) = 1/3 * 2/3 * 2/3 \approx 0.148$$

**Spam**

## 3-gram of “david”

- Features:
  - Words
  - Lengths of words
  - Letters
  - Images
  - *N-grams of words*

(\_da, dav, avi, vid, id\_)

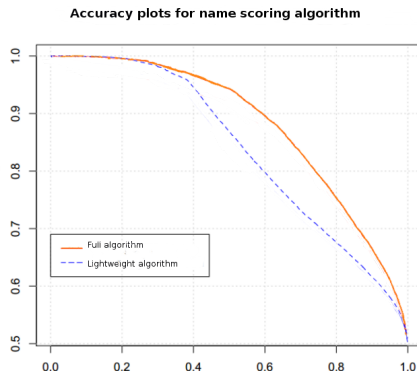

# Multinomial Bayes Testing

- Freeman 2013
- LinkedIn account names
- 60 million accounts
  - 100,000 were chosen to be tested, 50,000 spam and ham
- N-gram values 3(Lightweight) and 5(Full)
- 110 MB vs 974 MB

## Accuracy plots for name scoring algorithm

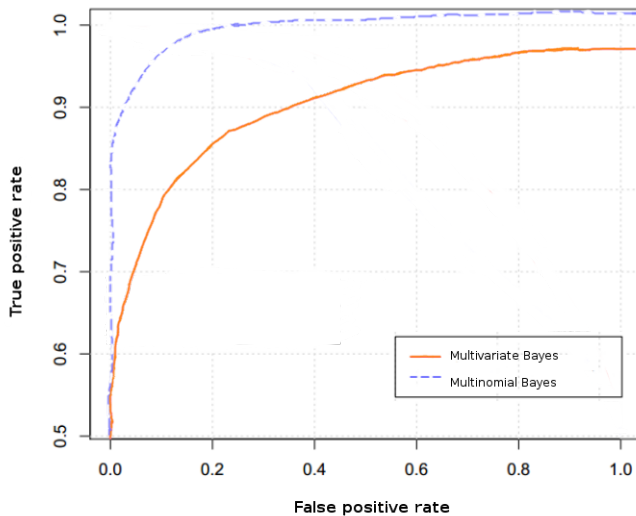

- Larger data sets  $\Rightarrow$  Lightweight algorithm
  - Memory tradeoffs become more relevant
  - More reliable for more documents
- Both more effective than previous algorithm
  - Based on regular expressions
- Chose Full algorithm
- Cut false positive rate in half

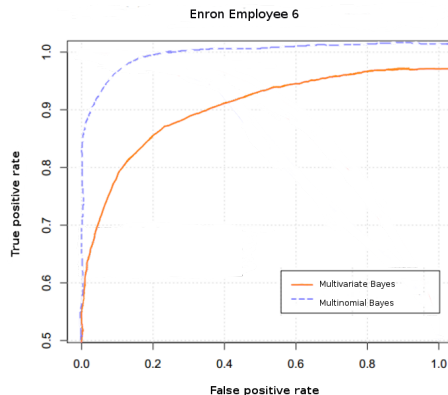

- Athens University of Economics and Business
- Data collected from Enron employees
  - Subject line and body
  - Ham only
- Mixed in unique generic spam emails
- Emulate real-time spam filtering
- Ordered the emails chronologically (complicated)
- 43,000 ham, 50,000 spam
- Clustered emails into chunks of 100
- Filter updated after each chunk

Enron Employee 6

- Multivariate Bayes performed relatively poorly
- Multivariate Bayes still moderately effective
- Less effective than Multinomial Bayes
- Multinomial Bayes performed best in all cases

# Advantages and Disadvantages of Bayesian Spam Filtering

## Advantages

- Adjustable accuracy
- Different models for different needs
- User control
- Constantly adapts

## Disadvantages

- Training data
- Training time and memory usage
- *Bayesian poisoning*

Thank you!
