Introduction: Example

- While designing a school system, you need to balance school construction cost with student transit time
 - You could spend lots of money on schools and have a low travel time
 - You could spend less money to build one school and have high travel time

Introduction: Pareto Front

- Two-objectives:
 - X-axis is the construction cost for schools
 - Y-axis is the average student travel time
- Red points are the *Pareto front*
 - The non-dominated (best) points for a problem
 - Either higher or to the right of non-Pareto front points

Introduction: Big Questions

- You want *diversification*
 - Wide variety of points
- How do you make sure you found all of the points?
- What if there's a hole in the Pareto front?

Outline

1. Background

- a. Quick Graph Legend
- b. Gaps on the Pareto Front

2. Detecting Gaps (Pellicer et al)

- a. Multi-Objective Evolutionary Algorithm
- b. Many-Objective Evolutionary Algorithm
- c. Find Potential Gaps
- d. Validate the Gaps

3. Filling Gaps (Pellicer et al)

- a. Focused Multi-Objective Evolutionary Algorithm
- b. Focused Many-Objective Evolutionary Algorithm
- c. Refresher on Gaps
- d. Classifying Gaps

4. Results (Pellicer et al)

- a. Legend for Graphs
- b. ZDT3
- c. DTLZ2
- d. Steel Industry
- e. Slung-Load Quadrotor (Ergezer)

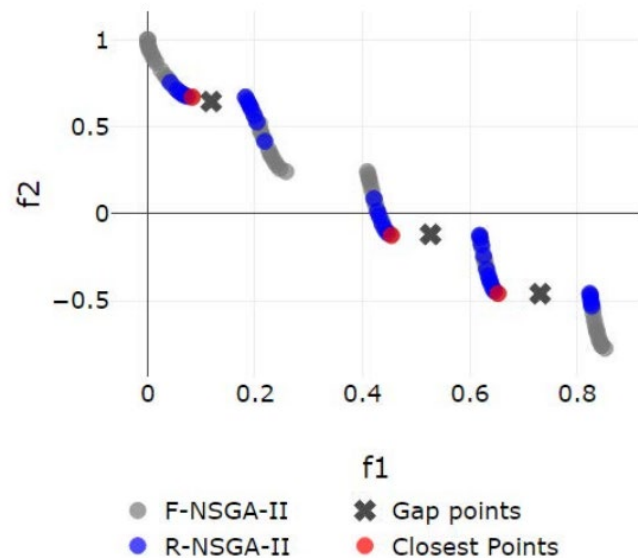

5. Conclusion

Outline

1. **Background**
 - a. Quick Graph Legend

2. Detecting Gaps (Pellicer et al)
 - a. Multi-Objective Evolutionary Algorithm
 - b. Many-Objective Evolutionary Algorithm
 - c. Find Potential Gaps
 - d. Validate the Gaps
3. Filling Gaps (Pellicer et al)
 - a. Focused Multi-Objective Evolutionary Algorithm
 - b. Focused Many-Objective Evolutionary Algorithm
 - c. Refresher on Gaps
 - d. Classifying Gaps
4. Results (Pellicer et al)
 - a. Legend for Graphs
 - b. ZDT3
 - c. DTLZ2
 - d. Steel Industry
 - e. Slung-Load Quadrotor (Ergezer)
5. Conclusion

Quick Graph Legend

- Grey is original Pareto front
- Black “x” is/are the gap point(s)
- Blue is a focused search Pareto front
- Red is/are closest point(s) to gap point(s)

Gaps on the Pareto Front

- An empty space between two groups of points on a graph
- Can be deemed *natural* or *artificial* once it is *validated*
 - *Validated* means the gap is an actual gap
 - *Natural* implies no point can exist in that space
 - *Artificial* means the gap is considered filled

Outline

1. Background
 - a. Quick Graph Legend
 - b. Gaps on the Pareto Front
- 2. Detecting Gaps (Pellicer et al)**
 - a. Multi-Objective Evolutionary Algorithm
 - b. Many-Objective Evolutionary Algorithm
 - c. Find Potential Gaps
 - d. Validate the Gaps
3. Filling Gaps (Pellicer et al)
 - a. Focused Multi-Objective Evolutionary Algorithm
 - b. Focused Many-Objective Evolutionary Algorithm
 - c. Refresher on Gaps
 - d. Classifying Gaps
4. Results (Pellicer et al)
 - a. Legend for Graphs
 - b. ZDT3
 - c. DTLZ2
 - d. Steel Industry
 - e. Slung-Load Quadrotor (Ergezer)
5. Conclusion

Non-dominated Sorting Genetic Algorithm II (NSGA-II)

- Handles multi-objective optimization (2-3 objectives)
- Implements a better system for diversification
- Improved the computational complexity of evolutionary algorithms at the time

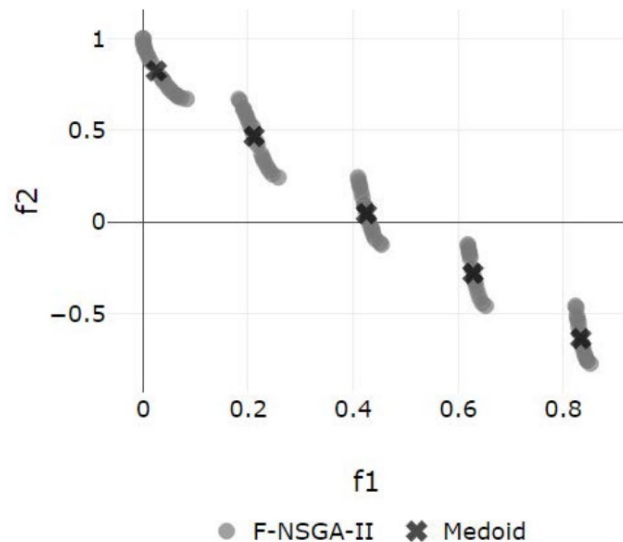

Non-dominated Sorting Genetic Algorithm III (NSGA-III)

- Builds off of NSGA-II to handle many-objective optimization (3+ objectives)
- Uses an additional method of reference points to improve diversification
 - Reference points consider points closer to it better

Finding Gaps

- Created an algorithm to find and validate gaps
- Organize Pareto front into groups
- Find the most isolated cluster and *validate* the gap
- If the gap is validated, save it and add a new cluster for that gap

Validating Gaps

- Take every point found through the algorithm and run equation 1
 - K is number of gap points
 - N is Pareto front size
- $d_{G-EMO} > 1$ means the gap is *validated*
- $d_{G-EMO} < 1$ means the gap isn't real

$$d_{G-EMO} = \frac{\frac{1}{K} \sum_{i=1}^K (\min_{j=1}^N \|G_i - F_j\|_2)}{\frac{1}{N} \sum_{i=1}^N (\min_{j=1}^N \|F_i - F_j\|_2)} \quad (1)$$

Outline

1. Background
 - a. Quick Graph Legend
 - b. Gaps on the Pareto Front
2. Detecting Gaps (Pellicer et al)
 - a. Multi-Objective Evolutionary Algorithm
 - b. Many-Objective Evolutionary Algorithm
 - c. Find Potential Gaps
 - d. Validate the Gaps
3. **Filling Gaps (Pellicer et al)**
 - a. Focused Multi-Objective Evolutionary Algorithm
 - b. Focused Many-Objective Evolutionary Algorithm
 - c. Refresher on Gaps
 - d. Classifying Gaps
4. Results (Pellicer et al)
 - a. Legend for Graphs
 - b. ZDT3
 - c. DTLZ2
 - d. Steel Industry
 - e. Slung-Load Quadrotor (Ergezer)
5. Conclusion

Reference point-based Non-dominated Sorting Genetic Algorithm II (R-NSGA-II)

- Useful for multi-objective problems (2-3 objectives)
- Utilizes the reference points from NSGA-III to target a specific area on the Pareto front

Reference point-based Non-dominated Sorting Genetic Algorithm III (R-NSGA-III)

- Used to target a specific area in a many-objective problem (3+ objectives)
- Uses an additional method to ensure even distribution among reference points, making results more diverse

Refresher: Gaps on the Pareto Front

- Empty space between two groups of points
- Can be deemed *natural* or *artificial*
 - *Natural* implies no point can exist in that space
 - *Artificial* means the gap is considered filled

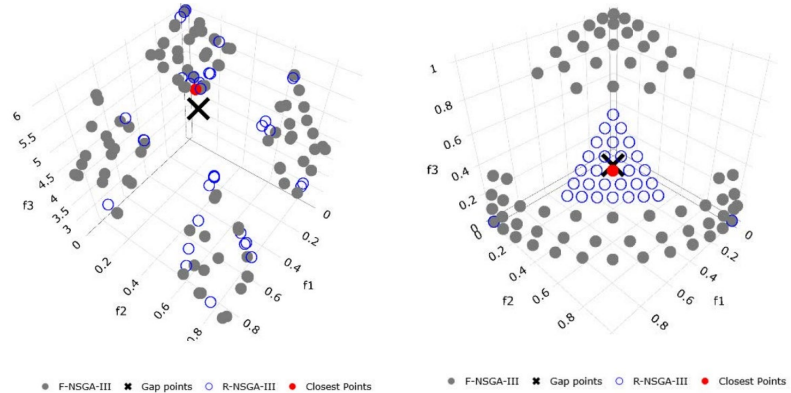

f1

- F-NSGA-II
- R-NSGA-II
- ✕ Gap points
- Closest Points

Classifying Gaps

- Take every validated gap point and run equation 2
 - K is number of gap points
 - N is Pareto front size
 - R is number of R-NSGA points
- $d_{R-G} > 1$ means the gap is *natural*
- $d_{R-G} < 1$ means the gap is *artificial*

$$d_{R-G} = \frac{1}{R} \sum_{i=1}^R \frac{\min_{j=1}^K \|RF_i - G_j\|_2}{\min_{j=1}^N \|RF_i - F_j\|_2} \quad (2)$$

1. Background
 - a. Quick Graph Legend
 - b. Gaps on the Pareto Front
2. Detecting Gaps (Pellicer et al)
 - a. Multi-Objective Evolutionary Algorithm
 - b. Many-Objective Evolutionary Algorithm
 - c. Find Potential Gaps
 - d. Validate the Gaps
3. Filling Gaps (Pellicer et al)
 - a. Focused Multi-Objective Evolutionary Algorithm
 - b. Focused Many-Objective Evolutionary Algorithm
 - c. Refresher on Gaps
 - d. Classifying Gaps
- 4. Results (Pellicer et al)**
 - a. Legend for Graphs
 - b. ZDT3
 - c. DTLZ2
 - d. Steel Industry
 - e. Slung-Load Quadrotor (Ergezer)
5. Conclusion

Legend for Graphs

- Grey is original Pareto front (NSGA-II(I))
- Black "x" is/are the gap point(s)
- Blue is new Pareto front (R-NSGA-II(I))
- Red is/are closest point(s) to gap point(s)

ZDT3 Problem

- Two-objective test problem
- Utilizes NSGA-II to generate its Pareto front and R-NSGA-II to fill gaps
- Has a discontinuous graph with visual holes
- f_1 and f_2 represent the two objectives being optimized
- Ran with one gap point and three gap points

ZDT3 Results

- One gap point
 - $d_{G-EMO} = 2.876$, meaning the gap is validated
 - $d_{R-G} = 1969.522$, meaning the gap is natural
- Three gap points
 - $d_{G-EMO} = 5.316$, meaning the gaps are validated
 - $d_{R-G} = 35.897$, meaning the gaps are natural

DTLZ2 Problem

- Three-objective test problem
- Utilizes NSGA-III to generate its Pareto front and R-NSGA-III to fill gaps
- Has a spherical shape for its Pareto front
- Two variations: DTLZ2^{orig} and DTLZ2^{void}
 - DTLZ2^{orig} is the full Pareto front
 - DTLZ2^{void} is incomplete
- f_1 , f_2 , and f_3 represent the three objectives to optimize
- Ran with one gap point and five gap points

DTLZ2^{orig} Results

- One gap point
 - Algorithm was run three times
 - $d_{G-EMO} = 0.0006, 0.604, \text{ and } 0.540$, meaning the gap is not valid
 - R-NSGA-III was never run

DTLZ2^{void} Results

- One gap point
 - $d_{G-EMO} = 1.330$, meaning the gap is validated
 - $d_{R-G} = 0.680$, meaning the gap is artificial and got filled
- Five gap points
 - $d_{G-EMO} = 1.124$, meaning the gaps are validated
 - $d_{R-G} = 0.572$, meaning the gaps are artificial and got filled

● F-NSGA-III ✕ Gap points ○ R-NSGA-III ● Closest Points

● F-NSGA-III ✕ Gap points ○ R-NSGA-III ● Closest Points

 - a. Legend for Graphs
 - b. ZDT3
 - c. DTLZ2
 - d. Steel Industry**
 - e. Slung-Load Quadrotor (Ergezer)
5. Conclusion

Steel Industry Problem

- A real-world example of a five-objective test problem
 - A coil factory transforming sheets of steel into coils
- Looks to optimize:
 - The time to complete the order
 - Importance of the project being completed at that given moment
 - Production cost
 - Maintenance expenses
 - Scheduling constraints
- Known to have gaps in its Pareto Front
- Ran with one gap point and three gap points

Steel Industry Results

- One gap point
 - $d_{G-EMO} = 2.302$, meaning the gap is validated
 - $d_{R-G} = 1.442$, meaning the gap is natural
- Three gap points
 - $d_{G-EMO} = 2.430$, meaning the gaps are validated
 - $d_{R-G} = 1.688$, meaning the gaps are natural

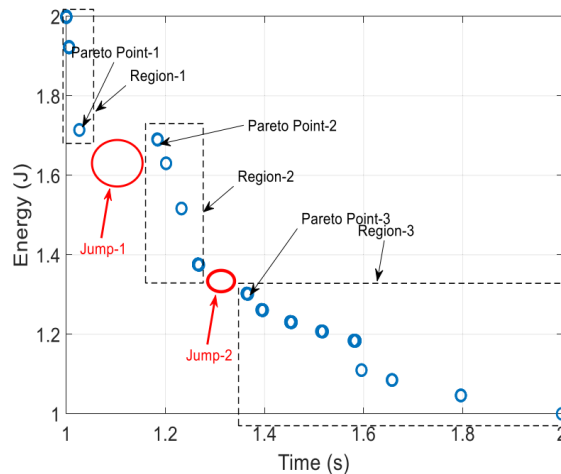

Slung-Load Quadrotor Problem (Ergezer)

- Three-objective problem in the real-world
 - A drone holding a package underneath with a rope
 - Trying to avoid obstacles
- Looks to optimize:
 - Minimize path length
 - Minimize time
 - Conserve energy
- Optimizes two objectives at a time
- Uses NSGA-II and R-NSGA-II

Results from Ergezer

- Scenario 1 (Path Length vs Energy):
 - $d_{R-G} = 1.151$, meaning the gaps are natural
- Scenario 2 (Energy vs Time):
 - $d_{R-G} = 1.782$, meaning the gaps are natural

Conclusion

- Finding and validating gap points allows R-NSGA algorithms to search for additional points and therefore have the potential to find more solutions
- Having a wider variety of solutions gives us more to choose from
- Real-world uses:
 - Steel industry example
 - Quadrotor example
 - Decision-makers
