Introduction ●0000	Background 00000 000	<i>intuitR</i> 000 00 00000	Experiment and Results 00 00	

Motivation

Want to write program that assigns each vertex of a planar graph a color, such that no two adjacent vertices are the same color, using smallest number of different colors.

Introduction •0000	Background 00000 000	<i>intuitR</i> 000 00 00000	Experiment and Results 00 00	

Motivation

Want to write program that assigns each vertex of a planar graph a color, such that no two adjacent vertices are the same color, using smallest number of different colors.

Four Color Theorem

No more than 4 colors are needed to color a planar graph in this way.

Introduction ●0000	Background 00000 000	<i>intuitR</i> 000 00 00000	Experiment and Results 00 00	

Motivation

Want to write program that assigns each vertex of a planar graph a color, such that no two adjacent vertices are the same color, using smallest number of different colors.

Four Color Theorem

No more than 4 colors are needed to color a planar graph in this way.

Proof gives step by step details of how to a color any graph in this way, can write our algorithm based on the proof. Call this a *constructive proof*.

Non-Constructive Proof Example

Want to show the existence of irrational numbers a and b, such that a^b is rational.

Non-Constructive Proof Example

Want to show the existence of irrational numbers a and b, such that a^b is rational.

Assume $\sqrt{2}^{\sqrt{2}}$ is either rational or irrational.

Non-Constructive Proof Example

Want to show the existence of irrational numbers a and b, such that a^b is rational.

Assume $\sqrt{2}^{\sqrt{2}}$ is either rational or irrational.

But don't know which.

Introduction	Background			
00000	00000	000 00 00000	00 00	

Intuitionistic Logic

Logic system that attempts to emulate/force constructive proofs

Same as classical logic, except it doesn't allow:

- Law of Excluded Middle: $p \lor \neg p$
- ▶ Double Negation Elimination: $\neg \neg p \equiv p$

Intuitionistic Propositional Logic (IPL)

Propositional logic form of intuitionistic logic, i.e. no quantifiers (\forall and $\exists)$

 $\mathsf{Only}\,\,\wedge,\vee,\neg,\rightarrow,\bot,\top$

Difficult to determine IPL-validity, so use IPL-provers like *intuitR* by Fiorentini (2021) or *intuit* by Claessen and Rosén (2015)

and Models			

Determining IPL-validity

A formula α is IPL-valid iff for every kripke model with root r, $r \models \alpha$.

Call a kripke model where the root $r \nvDash \alpha$ a *countermodel* for α

	Background 0000● 000	<i>intuitR</i> 000 00 00000	Experiment and Results 00 00	
Kripke Semantics ar	nd Models			

Example

Countermodel for
$$p \lor \neg p$$
:

$$(\{k, k'\}, \delta, \leq, k), \text{ where}$$

$$\delta(k) = \emptyset$$

$$\delta(k') = \{p\}$$

$$k < k'$$

Figure: Visual representation of Kripke Countermodel for $p \lor \neg p$
